

NFF CO-MANAGED LAYER 8 SECURITY SERVICE

Supporting the 8th Layer of Cyber Defense – Your People

To mount an effective cyber defense, attention across all seven layers of the original OSI model is required. Today, cyber security experts include an eighth layer, known as “Layer 8,” which represents the human factor, emphasizing the pivotal role a cybersecurity culture plays across the organization to ensure adherence to optimal security measures. To deliver effective security, organizations need a methodical approach to addressing the human impact on cyber defense.

NFF is your co-managed cybersecurity services provider to ensure Layer 8 security.

Do you have a robust cybersecurity culture?

The NFF Difference: Effective Training Through Testing

Layer 8 training requires frequent user testing to ensure optimal results. NFF is your trusted partner providing the expertise and experience required to maximize the impact of training and testing tools. Our service includes campaign editing and monitoring, which are essential for maintaining an appropriately challenging testing environment. Your organization will see the results and the ROI through our enterprise level reporting, ready to share with leadership, cyber security auditors, and insurance providers.

MSP Verify™ is a comprehensive certification specifically tailored for managed service providers. This accreditation is designed to go beyond mere validation, offering a robust framework that provides assurance, generates trust, and communicates transparency to consumers of managed IT services. **NFF is now ranked in the top 3% of MSPs worldwide by achieving Cyber Verify Level 2.**

A Co-Managed Approach to Layer 8 Security

People are the last layer of defense in cybersecurity, and often the weakest link in the chain. Because no hardware or software control can deliver 100% security effectiveness, organizations need to combine these controls with deliberate attention to the human element. With NFF's Co-Managed Layer 8 Security Service, organizations can move people to a higher security comprehension, elevating their awareness around cybersecurity best practices.

> Training:

Training campaigns are critical to advancing a cybersecurity culture. NFF's co-managed service will proactively deploy micro training and distribute videos, quizzes, general awareness campaigns, and emails related to current topics of interest. As a full-platform approach, it also enables organizations to deliver home-grown, non-IT training, if desired.

> Testing:

To ensure the training is hitting the mark, NFF will send out test phishing emails and other simulated exercises. These campaigns can be set to deploy monthly, or as often as the organization deems necessary. Testing for specific topics and different levels of difficulty is also available. Additionally, optional rules can be activated when benchmarks are not attained. For example, if a user fails a phishing test a certain number of times, they are automatically enrolled into remedial training.

> Reporting:

To track the success of the initiatives, reports are generated to demonstrate how the company is trending compared to industry benchmarks. Individual reports are also available. This reporting functionality facilitates the establishment of evidence for compliance requirements.
