

# NFF CO-MANAGED MICROSOFT 365 LOCKDOWN SERVICE

## A Full Lifecycle Cybersecurity Service for Microsoft 365

Microsoft 365 is woven into the fabric of many businesses, as well as institutions across government and education. Securing Microsoft 365 environments is critical in an increasingly adversarial cyber landscape. To meet the threat, organizations need a full lifecycle cybersecurity solution — spanning prevention, detection and recovery — for the entire Microsoft 365 environment that's supported by an expert partner with the skills and experience to ensure success.

**NFF is your co-managed cybersecurity services provider to optimize security while maximizing value.**

# Do You Know Your M365 Secure Score?

## The NFF Difference: Delivering Experience, Expertise

Your M365 environment is complex, with frequent configuration changes required to maintain a high level of security. When security teams lack the time, staff or skillsets needed to properly secure your environment, NFF delivers the expertise and experience to ensure your success.

**NFF delivers comprehensive security support across your complete M365 environment.**

MSP Verify™ is a comprehensive certification specifically tailored for managed service providers. This accreditation is designed to go beyond mere validation, offering a robust framework that provides assurance, generates trust, and communicates transparency to consumers of managed IT services. **NFF is now ranked in the top 3% of MSPs worldwide by achieving Cyber Verify Level 2.**

# A Co-Managed Approach to Securing M365

NFF's Co-Managed Service is a partnership between NFF certified technical experts, NFF strategic partners, our 24 x 7 Network Operation Center & Helpdesk, and YOUR IT team.

The NFF Co-Managed Microsoft Lockdown Service ensures full and continuous cybersecurity across the Microsoft 365 ecosystem.

## > Prevention:

The Microsoft Secure Score is a measurement of an organization's security posture that delivers recommendations to help protect the organization from threats. Microsoft provides the score, but it takes analysis and expertise to implement the 75+ recommended configuration settings for optimal effect. With NFF, our experts handle the impact analysis and configuration of M365 and implement CISA recommendations to further enhance security.

## > Detection:

We install and integrate an AI-powered system to monitor for anomalies. The system can be programmed to immediately respond using automated actions to anomalies and potential warning signals. Examples of anomalies include:

- The system detects too many files being changed or deleted in too short a time.
- A user successfully logs in from an unexpected country.

## > Recovery:

Microsoft does not provide a backup of your M365 data, and its liability is limited to the service availability — not for the loss of your data. This creates a serious vulnerability risk because most compliance standards (e.g., HIPPA, PCI, CMMC, ISO, GDPR) and most cyber insurance policies require all data to be backed up. NFF delivers highly secure and reliable backups, utilizing encryption, replication, immutability and other safeguards.
